Actividad 1.1: Cargar el dataset y diagnosticar datos faltantes

Input data

Features: PassengerId, Pclass, Sex, Age, SibSp, Parch, Fare, Embarked
Meta attributes: Name, Ticket, Cabin
Target: Survived

Output data

Features: PassengerId, Pclass, Sex, Age, SibSp, Parch, Fare, Embarked
Meta attributes: Name, Ticket
Target: Survived

Removed: 1 (Cabin)

Actividad 1.2 : Widget Select Columns

Sampling type: Random sample with 80 % of data, stratified (if possible), deterministic

Input: 891 instances

Sample: 713 instances

Remaining: 178 instances

Actividad 1.2: Widget Data Sampler

Settings

Impute Missing Values: Average/Most frequent

Actividad 1.2: Widget Preprocesor

Data instances: 713
Features: 8

Actividad 1.3: Data Table Metodo Dummy

Workflow Parte 1 :

Actividad 1.1: Cargar el dataset y diagnosticar datos faltantes

Para Embarked, Feature Statistics reporta 2 valores faltantes (el conteo coincide con el notebook), pero muestra 0% porque redondea el porcentaje a números enteros; coincidiendo con el diagnóstico del notebook. No es una discrepancia en los datos, sino de precisión en la visualización del widget.

Actividad 1.3: Discretización de la edad

Al aplicar Entropy-MDL a Age, Orange devuelve <removed>, es decir, cero puntos de corte. Esto no es un error: el algoritmo de Fayyad-Irani que usa Orange no solo busca el mejor corte por ganancia de información, sino que además evalúa si esa ganancia justifica estadísticamente el corte (criterio de longitud de descripción mínima, MDL). Para Age, sobre las 713 filas de entrenamiento, ningún corte candidato superó ese umbral, así que Orange concluyó que ninguna división está suficientemente respaldada por los datos, y eliminó la variable.

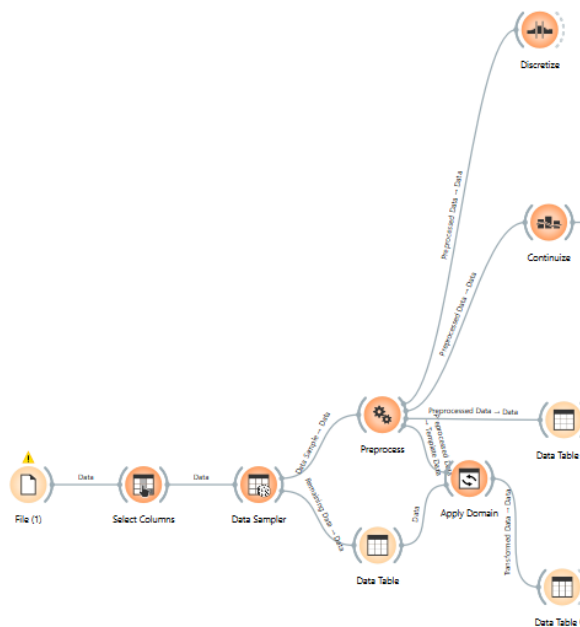

Esto contrasta con el notebook, donde el método usado sí encontró un corte útil (≈ 5.65 años), coherente con el patrón histórico de "mujeres y niños primero". La diferencia no es un error de configuración: Orange aplica una prueba estadística adicional de aceptación (MDL) que el método del notebook probablemente no aplica este último parece limitarse a encontrar el mejor corte por ganancia de información, sin verificar si esa ganancia "vale la pena" frente a la complejidad que añade. Es decir, ambos métodos son válidos, pero responden preguntas ligeramente distintas: "¿cuál es el mejor corte posible?" (notebook) vs. "¿existe algún corte que esté realmente justificado?" (Orange).

Actividad 1.3: Codificación de categóricas

One-hot encoding: genera 3 columnas nuevas Embarked=C, Embarked=Q, Embarked=S — coincidiendo exactamente con las Embarked_C/Q/S del notebook.

First value as base (dummy, N-1): genera 2 columnas nuevas — Embarked=Q, Embarked=S —, dejando C como categoría de referencia implícita, coincidiendo exactamente con las Embarked_Q/S del notebook (que también usó C como base al eliminar la primera columna).

Ambas opciones de Orange reproducen fielmente sus respectivas versiones del notebook, tanto en cantidad de columnas como en qué categoría queda excluida.

Actividad 1.2: Dividir train/test y tratar los datos sin fuga de información

Se verificó en ambos Data Table (entrenamiento y prueba) que las columnas Age y Embarked no presentan valores faltantes tras el preprocesamiento. La imputación se aplicó correctamente a las 178 filas de prueba usando la transformación aprendida en entrenamiento, sin recalcularse sobre el propio conjunto de prueba.

Age quedó imputada con el valor 29.1477. Cabe aclarar que este valor corresponde a la media (mean) y no a la mediana: el panel "Impute Missing Values" de Preprocess solo ofrece la opción "Average/Most frequent", que para variables numéricas usa la media, sin una alternativa nativa de mediana.

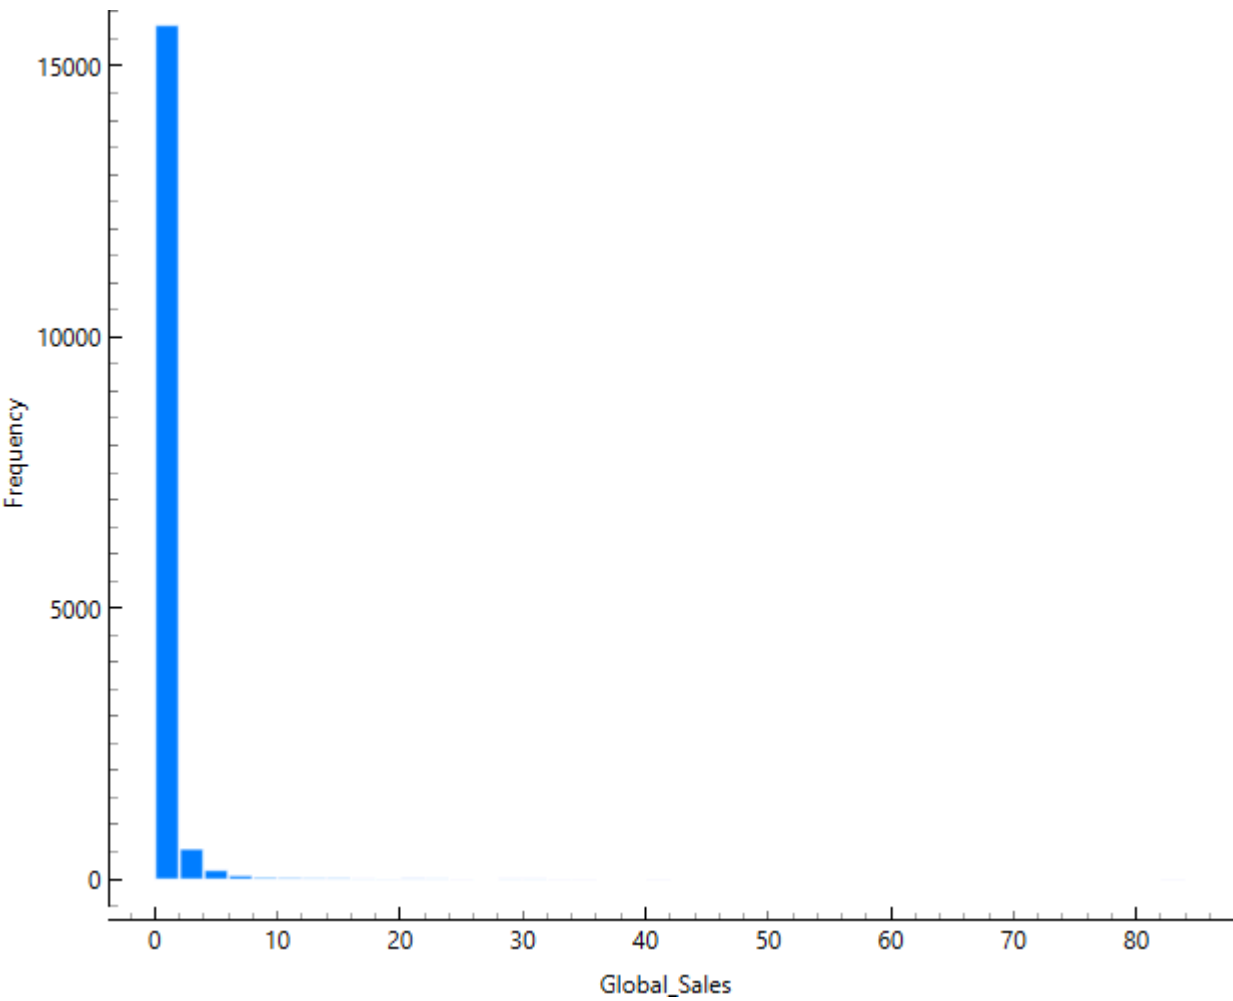

Comparado con el ≈ 28.5 que calculó el notebook usando específicamente la mediana, la diferencia (≈ 0.65 años) es coherente con lo esperado: en una distribución de edades con cierta asimetría, la media y la mediana no coinciden exactamente, y la media suele ser ligeramente más alta cuando hay valores de edad más dispersos hacia arriba.

Reflexion Final:

Dividir entrenamiento y prueba fue más fácil de entender visualmente en Orange ver el Data Sampler repartiéndose en dos ramas deja claro el concepto de que un lado alimenta el otro y no al revés. Sin embargo, implementar correctamente que la prueba use las mismas estadísticas del entrenamiento (evitar la fuga de información) resultó más difícil que en Python: el widget Preprocess no tiene una entrada para reutilizar el "preprocesador" aprendido, así que tuvimos que buscar alternativas con Apply Domain, algo que en Python se realiza con .fit() en train y .transform() en test, sin margen de error.

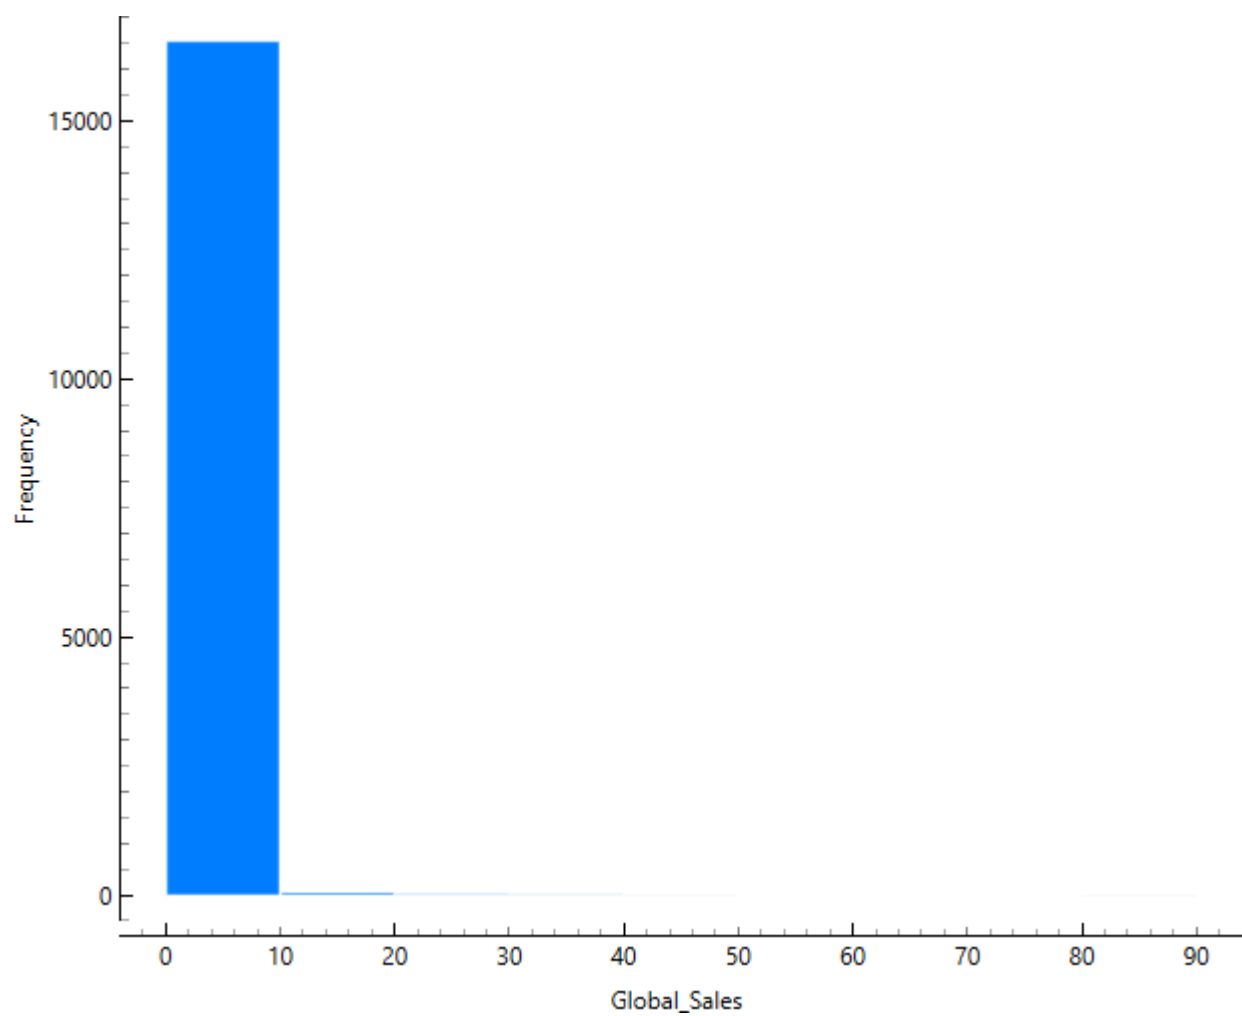

En Orange, cada paso pasa por interfaz visual, lo que fuerza a entender exactamente qué está pasando en el fondo pero también abre más oportunidades de cometer fugas sin notarlo si no se verifica cada conexión.

Con discretizar y codificar variables, Orange ganó en velocidad de exploración: probar Equal frequency, Equal width y Entropy-MDL fue cuestión de cambiar un botón y ver el resultado al instante, sin reescribir código para cada variante. Sin embargo, algunas opciones de Orange no se comportan exactamente igual que sus equivalentes de Python (por ejemplo, el método de Entropy-MDL de Orange aplica una prueba estadística adicional que puede rechazar cortes que Python sí acepta), en Python esas decisiones quedan más explícitas en el código, aunque toma más tiempo escribirlas.
